Scheduling > Maintenance > MSALGO > Export

Master Schedule Algorithm (MSALGO) is used to help you create a master schedule. This page extracts all course records and student course requests for next year, and creates a matrix of conflicts and a list of requests for all courses. The export also extracts Scheduling options, such as grade level range, period range, and number of semesters to an MSALGO table.

Match proxy courses are exported as the individual courses that make up the proxy.
